WEEK 1

The contents of this week are relatively simple; it comes to defining and framing the main topic of the course: The study and design of digital systems.

The week consists of three video-lectures in which we will see what are the digital systems, how to describe them unambiguously and how to build digital circuits using electronic components. Finally, two videos about the processor are included in which, based on examples seen in previous lessons, we will introduce the processor's main characteristics.

CONTENTS

		min (aprox)
L1.1	Digital systems	
	1. Physical system	00:15
	1.1 Physical system: Control of a boiler	01:26
	Analog signals vs digital (or discrete) signals	04:50
	1.2 Physical system: chronometer	05:16
	Digital system definition	08:23
	Summary	10:59
L1.2	Digital system description	
	1. Functional description	00:20
	1.a Explicit functional description	00:48
	1.b Implicit functional description (algorithm)	02:05
	2. Structural description	05:35
	3. Hierarchical description	08:14
	Summary	10:18
L1.3	Digital electronic systems (1/2)	
	1. Previous observations	00:23
	2. Digital components 2.1 Binary codification	02:44
	2.2 MOS transistors	03:20
	2.3 MOS transistors used as switches	04:02
	2.4 El CMOS inverter	07:52
	2.5 NAND gate	09:35
	2.6. Other components (NOR, AND, OR, buffers, ROM)	11:12
	NOR, AND, OR	11:15
	Buffers	13:29
	ROM	14:20
	3. Synthesis of Electronic Digital Systems	15:27
	Summary	16:05

P1.1	Processor: Specifications	
	1. Specification of two digital systems	00:26
	2. Design strategies	01:30
	Summary	10:44
P1.2	Examples of programs	
	1. Temperature controller	00:20
	2. Chronometer	11:45
	Summary	18:53
